March 4, 1996

The Honorable Floyd Spence
Chairman, Committee on National Security
House of Representatives

Dear Mr. Chairman:

As you requested, this report is an unclassified version of our earlier classified report on military readiness. We analyzed military readiness data contained in the Department of Defense's (DOD) Status of Resources and Training System (SORTS) to determine if the data showed significant changes in readiness since 1990—a year of peak readiness. This report provides readiness information for the four military services. Specifically, it (1) summarizes the reported overall readiness status of all military units from January 1, 1990, to March 31, 1995; (2) assesses readiness trends of selected units from each service for the same period, and, where applicable, discusses reported readiness problems experienced throughout a service and by the selected units; and (3) explains significant changes in reported readiness of the selected units.

On August 31, 1995, we briefed the Subcommittee on Military Readiness, House Committee on National Security, staff on the results of our work. This report summarizes the information we presented in that briefing.

Background

SORTS is DOD's automated reporting system that identifies the current level of selected resources and training status of a unit—that is, its ability to undertake its wartime mission. Units report their overall readiness status as well as the status of four resource areas (personnel, equipment and supplies on hand, equipment condition, and training).¹ Overall readiness status is generally reported at a level consistent with the lowest rated resource level, but commanders are allowed to subjectively upgrade or downgrade the overall rating. SORTS is an internal management tool used by the Chairman of the Joint Chiefs, services, and combatant commands. It provides the Chairman with the necessary unit information to achieve an adequate and feasible military response to crisis situations and participate in the joint planning and execution process.

¹Readiness status of a unit is reported by assigning "C" levels that are defined as follows: C-1—Unit can undertake the full wartime mission for which it is organized or designed. C-2—Unit can undertake the bulk of its wartime mission. C-3—Unit can undertake major portions of its wartime mission. C-4—Unit requires additional resources and/or training to undertake its wartime mission, but if the situation dictates, it may be required to undertake portions of the mission with resources on hand. C-5—Unit is undergoing a service-directed resource change and is not prepared to undertake its wartime mission.

In viewing SORTS information, it should be noted that there are significant differences in the way each service manages readiness. For example, the Air Force's goal is to maintain all units at the C-2 level or better. In contrast, the Army uses a tiered resourcing system that maintains contingency units at the C-1 or C-2 level but allows later-deploying units to fall to the C-2 or C-3 level. The Navy and the Marine Corps manage readiness so that deployed units are C-1 or C-2. Units deployed or preparing for deployment have higher resource allocation priority than nondeployed units. Therefore, reported readiness fluctuates with deployment and maintenance cycles.

Results in Brief

DOD-wide, the percentage of military units with the ability to undertake all or major portions of assigned missions remained generally stable from January 1, 1990, to March 31, 1995.

Of the 94 units we reviewed, readiness remained at levels consistent with service goals in 75 (80 percent) of the units. However, readiness declined below the goals in 19 (20 percent) of the units. In five of these units, the readiness reductions were for fairly short periods of time due to the units' participation in contingency operations. In the remaining units, readiness reductions were caused primarily by personnel shortages, equipment shortages, and difficulty in obtaining training for personnel in certain military occupations.

In the Navy units we analyzed, ships maintained the desired readiness levels when periods of planned maintenance and training were excluded. However, the readiness of Navy aviation squadrons declined in the training area—a problem we found was Navy-wide. The reduction was caused by personnel shortages related to the Navy's decision to increase the number of aircraft authorized in some squadrons and a shortage of funds to pay for the flying hours needed to keep pilots qualified. As a result, from April 1994 through March 1995, the number of naval aviation units reporting the desired readiness levels declined by 27 percent. Although the funding problem was alleviated at the beginning of fiscal year 1995, the Navy has been unable to raise the readiness to previous levels.

In the Marine Corps units we analyzed, the readiness for ground combat units remained at desired levels throughout the period, whereas the readiness of support and aviation units fluctuated or remained stable at a lower level. This happened because these units continuously provided detachments to deploying ships and Marine Expeditionary Units. Although

a constant drain of personnel and equipment depressed the reported readiness of parent units, Marine Corps officials said that this practice reflected normal operations and that they considered the readiness of these units to be adequate, albeit at a level lower than desired. Officials attributed this situation to Marine Corps-wide problems in training personnel for certain occupational specialties. Since the Corps does not have its own training capability for skilled specialties, it must rely on the other military services to provide it. Officials expect it will take about 2 years to resolve this problem.

Readiness for most active Army infantry, armor, and artillery units we analyzed remained high for contingency units and generally stable for later deploying units. There were, however, significant changes or fluctuations in the readiness of five active Army units due to contingency operations. These units were used to support operations such as Somalia, thereby decreasing their availability to the parent units or inhibiting the deployed units' ability to train its personnel. Also, Army National Guard combat units experienced readiness reductions. Officials attributed the reductions to comprehensive readiness reporting criteria that provide a more accurate portrayal of personnel availability and to the difficulty of getting guardsmen trained in occupational skills. National Guard units also overstated their readiness by understating the number of training days required to achieve a C-1 status. Lastly, some commanders subjectively upgraded their units' overall status. Officials told us they could not determine in retrospect whether the upgrades were justified.

Readiness for Air Force units we analyzed generally remained at desired levels. However, there was some reduction or fluctuation in the readiness of airlift and Airborne Warning and Control System (AWACS) units. Air Force officials said this condition occurred because aircraft have been continuously committed to the operations in Saudi Arabia, Somalia, and Bosnia. Officials said heavy usage of airlift aircraft have strained the supply of spare parts and engines. The constant use of AWACS aircraft for contingency and counterdrug operations affected the Air Force's ability to train crews and maintain required skills. We also noted that commanders sometimes reported overall readiness levels higher than the measured resource areas. Air Force officials said they consider this SORTS feature to be a strength of the system. They believe that a commander is in the best position to accurately assess the readiness of a unit on the basis of a wide range of information available to make this judgment.

Scope and Methodology

DOD has over 10,000 units that report readiness status under SORTS. We analyzed the overall readiness reported for all units since January 1, 1990. In addition, we performed a detailed analysis of all readiness data reported for a cross-section of units² in each service. To ensure that we obtained adequate coverage, we asked service officials to help us select specific units that would represent the various types of units within the service. The units selected are not a statistical sample, and the results of our analyses cannot be projected to the entire service. The units included in our review are shown in appendix II.

The Joint Chiefs of Staff established the requirements for specific data that each service must report. In addition, the Army, the Navy, and the Air Force identified a number of service-unique indicators that their units are required to report. We selected indicators from this universe that we believe are most relevant to identifying readiness trends. In general, these indicators comprised the overall C-rating for the unit, the C-rating for each of the four measured resource areas, and data elements that are used to determine the C-rating in each measured area. (See app. II.)

For the selected units, we graphed the data elements and identified trends. Where we noted changes in historical trends or in units that dropped below C-2 for extended periods, we compared the readiness data with operational scheduling and maintenance data and discussed these conditions with readiness officers from the respective services. Briefing sections I-IV of this report contain summary data for each service.

With the exception that we did not assess the reliability of SORTS data provided by the services, our review followed generally accepted government auditing standards and was conducted from November 1994 through July 1995.

In written comments on a draft of our report, DOD agreed with the information presented. (See app. I.) We are sending copies of this report to the Chairmen, Senate and House Committees on Appropriations; the Chairman, Senate Committee on Armed Services; and the Secretaries of Defense, the Army, the Navy, and the Air Force. Copies will also be made available to others upon request.

²For our analyses, we selected the following reporting organizations: Navy ships, submarines, and aircraft squadrons; Marine Corps and Army battalions, support groups, and squadrons; and Air Force wings and squadrons.

The major contributors to this report are listed in appendix IV. If you or your staff have questions about this report, please call me on (202) 512-5140.

Sincerely yours,

A handwritten signature in black ink that reads "Mark E. Gebicke". The signature is written in a cursive, flowing style.

Navy Readiness Trends: January 1990-March 1995

GAO Summary of Navy Readiness Trends

- Percentage of units that reported C-1 to C-3 for overall readiness was stable.
- For the cross-section of units:
 - Ship readiness remained stable.
 - Aviation readiness was reduced.

The percentage of units that reported an overall readiness status of C-1 to C-3 was stable. The readiness reported for 15 of the 16 ships included in our analysis fluctuated cyclically between when they were deployed and not deployed or undergoing maintenance. Five of eight aviation units showed a similar readiness trend. In the remaining units, we identified significant reductions in readiness levels.

Only one Navy ship experienced a reduction in readiness, as compared to several aviation units. In explaining the reduced readiness in aviation units, Navy officials said that during the past year, the training readiness of aviation squadrons Navy-wide declined significantly.

Officials attributed the reduction to two major factors. First, contingency operations caused a shortage of flying hour funding in late 1994, which significantly reduced training readiness. We did not verify the funding shortage. Second, personnel shortages were caused by force structure changes that increased the number of authorized aircraft in some squadrons. In August 1994, the number of squadrons that reported C-1 or C-2 in training declined by 15 percent from only 3 months earlier. The funding shortage was alleviated at the beginning of fiscal year 1995, but training readiness has not yet reached previous levels.

Marine Corps Readiness Trends: January 1990-March 1995

GAO Summary of Marine Corps Readiness Trends

- Percentage of units that reported C-1 to C-3 for overall readiness was stable. However, the percentage that reported C-1 or C-2 declined.
 - For the cross-section of units:
 - Ground combat forces were stable at high levels.
 - Continuous deployment of people and equipment caused cyclical changes in support units.
-

Although the percentage of units that reported C-1 to C-3 for overall readiness was stable, the percentage that reported C-1 or C-2 declined. Readiness in the seven Marine Corps ground combat units we reviewed was stable at desired levels. Likewise, readiness in 7 of the 13 aviation and support units remained stable at desired levels. However, we noted significant fluctuations or changes in the reported readiness of five aviation, maintenance, and support units and one instance in which a squadron's training rating dropped due to insufficient flying hours late in fiscal year 1994.

Marine Corps officials contended that these changes generally reflect normal variations due to the way the Corps organizes and deploys its forces. For example, many Marine Corps aviation and support units are not deployed as a single entity that reports readiness. Instead, the units provide detachments, comprised of mission-ready personnel and equipment, to a deploying Marine Expeditionary Unit. This necessarily degrades the readiness status of the parent unit, which then begins to build toward its next commitment. This continuous cycle of deploying the best-trained personnel and mission-ready equipment may cause changes in the reported status of the unit or cause it to remain at a low level over time.

Officials said that although readiness for many of the units was stable, it was not at the desired level. They said that there are Corps-wide problems in providing sufficient personnel trained in many of the low-density, highly skilled military occupational specialties. Officials attributed this largely to the planned force-structure reduction designed to reduce the Corps to 159,000 personnel. Although this level was subsequently changed to 174,000, the Corps meanwhile had lost many of its skilled personnel and forfeited future training opportunities. Since the Corps does not have its own facilities to train personnel for these skills, it relies on the other services to provide training. Officials expect it will take about 2 years to correct this deficiency.

Army Readiness Trends: January 1990-March 1995

GAO Summary of Army Readiness Trends

- Percentage of units that reported C-1 to C-3 for overall readiness was stable.
 - For the cross-section of units:
 - Readiness for most units was stable.
 - Readiness for some units was affected by contingency operations.
 - Readiness of National Guard combat units declined and units consistently overstated readiness.
 - Subjective upgrades were used.
-

The percentage of units that reported C-1 to C-3 for overall readiness was stable. We noted significant changes or fluctuations in reported readiness for active Army units due to contingency operations and equipment maintenance problems, a general reduction in readiness reported by National Guard units and, in some cases, commanders' subjective upgrades of overall readiness ratings.

Five of the units included in our analysis were used to respond to contingency situations, which affected readiness for fairly short periods of time. Officials said that such use of units may affect readiness in two ways. First, if only part of the reporting unit is deployed, certain resources available to the unit are depleted, thereby degrading readiness in such areas as personnel and equipment on hand. Second, if a unit is engaged in one role, such as peacekeeping or security operations, it may be unable to train personnel in the full range of military skills or to maintain its equipment in mission-ready condition.

We noted a reduction in readiness for National Guard combat units, which Army officials attributed to more stringent reporting requirements and the difficulty of getting personnel trained in the needed occupational skills. Moreover, our analyses disclosed that two of the four National Guard combat units we analyzed appear to have understated the number of training days required to achieve C-1 status.

In several instances, Army unit commanders subjectively upgraded their units' overall status. Army officials told us there was no way of determining in retrospect whether the upgrades were justified. They said many commanders view the SORTS reports as "report cards" on their performance and will therefore make every effort to present the unit in the best light. Officials also explained that a commander's subjective assessment to upgrade or downgrade readiness is a standard, deliberate part of the process that provides a more complete assessment of a unit's readiness.

Air Force Readiness Trends: January 1990-March 1995

GAO Summary of Air Force Readiness Trends

- Percentage of units that reported C-1 to C-3 for overall readiness was stable.
 - For the cross-section of units:
 - Readiness for most units was stable, with reserve units noticeably more stable.
 - Continuous commitments affected readiness of airlift and specialty units.
 - Subjective upgrades were used.
-

The percentage of units that reported C-1 to C-3 for overall readiness was stable. Readiness remained generally stable in most of the units we reviewed. Guard and reserve units were the most stable. In three of the units, there was some reduction or fluctuation in reported readiness, primarily among airlift and specialty aircraft units. Air Force officials generally attributed the changes to continuous use of the aircraft for contingency operations and the resulting strain on the supply of spare parts and engines. We also noted that Air Force commanders sometimes

upgraded their units' overall readiness status above the level indicated by the four measured resource areas.

Included in our sample were four Air Force Reserve and four Air National Guard units—two fighter squadrons and two airlift squadrons from each. Reported readiness in these units remained at high levels throughout the period. Air Force officials attributed this condition to the Air Force policy of viewing reserve components as an integral part of the total force. They said that the reserve units had equal access to the supply system in obtaining spare parts, were usually staffed with experienced pilots and maintenance personnel, and were generally not used as heavily as active component units.

Continuously using the aircraft to support Desert Storm, Somalia, and Bosnia operations, along with counterdrug operations, affected the reported readiness of Air Force units during this period. Particularly affected were the airlift units required to transport personnel, equipment, and supplies. For example, in fiscal year 1991, the C-141 fleet flew 58 percent over the planned flying hour program, and the C-5 fleet flew over by 175 percent. Heavy use of the C-141 and C-5 aircraft created a greater demand for spare parts and engines and accelerated the rate at which the aircraft required major repairs. Units with specialty aircraft, such as the E-3B Airborne Warning and Control System (AWACS), were also affected. These aircraft are an integral part of air operations and are in constant demand by the commanders in chief.

Finally, Air Force commanders sometimes upgraded the overall readiness status of their units. In some units we analyzed, commanders subjectively upgraded the overall readiness reported for extended periods of time (5 consecutive months or longer). Air Force officials said that they do not consider upgrades to be a problem. In fact, they consider the capability to do this to be a strength of the Status of Resources and Training System (SORTS) rather than a weakness. They believe that a commander is in the best position to accurately assess the readiness of a unit, on the basis of a wide range of information available to make this judgment. Commanders have the prerogative to upgrade or downgrade their unit's overall readiness status.

Comments From the Department of Defense

PERSONNEL AND
READINESS

THE OFFICE OF THE UNDER SECRETARY OF DEFENSE
4000 DEFENSE PENTAGON
WASHINGTON, DC 20301-4000

Mr. Mark E. Gebicke
Director, Military Operations and Capabilities Issues
National Security and International Affairs Division
U.S. General Accounting Office
Washington, DC 20548

Dear Mr. Gebicke:

This is the Department of Defense (DoD) response to the General Accounting Office (GAO) UNCLASSIFIED draft report entitled, "MILITARY READINESS: Data and Trends Since 1990," dated December 22, 1995, (GAO Code 703083), OSD Case 1006-AX. The DoD concurs with the report and appreciates the time and work the GAO put forth in this effort.

The UNCLASSIFIED draft report summarizes a previous SECRET GAO report on the same issue. Consistent with the SECRET report, the UNCLASSIFIED draft states that, "DoD-wide the percentage of military units that have reported the ability to undertake all or major portions of assigned missions remained generally stable from January 1, 1990, to March 31, 1995." The report also cites readiness problems for a relatively small number of specific units. The Services examined each unit cited in the report and found that readiness problems have been addressed. In most cases recovery is complete, and for the remaining units, plans are in place to return units to their normal readiness levels or prepare them for inactivation. In many cases, corrective actions were ongoing at the time specific problems were reported. Moreover, the Department has in place a process to identify and correct readiness problems when they emerge. This process culminates in meetings of the Senior Readiness Oversight Council, chaired by the Deputy Secretary of Defense that is in turn supported by the Joint Monthly Readiness Review, chaired by the Vice Chairman of the Joint Chiefs of Staff. At these meetings, readiness concerns are identified, assessed, and where appropriate, action plans are set in motion to resolve these concerns. This process demonstrates the DoD's continuous vigilance and commitment to readiness as its first priority.

The Department appreciates the opportunity to comment on the draft report.

Sincerely,

Louis C. Finch
Deputy Under Secretary
Readiness

Ordering Information

The first copy of each GAO report and testimony is free. Additional copies are \$2 each. Orders should be sent to the following address, accompanied by a check or money order made out to the Superintendent of Documents, when necessary. VISA and MasterCard credit cards are accepted, also. Orders for 100 or more copies to be mailed to a single address are discounted 25 percent.

Orders by mail:

U.S. General Accounting Office
P.O. Box 6015
Gaithersburg, MD 20884-6015

or visit:

Room 1100
700 4th St. NW (corner of 4th and G Sts. NW)
U.S. General Accounting Office
Washington, DC

Orders may also be placed by calling (202) 512-6000 or by using fax number (301) 258-4066, or TDD (301) 413-0006.

Each day, GAO issues a list of newly available reports and testimony. To receive facsimile copies of the daily list or any list from the past 30 days, please call (202) 512-6000 using a touchtone phone. A recorded menu will provide information on how to obtain these lists.

For information on how to access GAO reports on the INTERNET, send an e-mail message with "info" in the body to:
